INTRODUCTION

In our day to day life fuel consumption by the increase of vehicles became more. As the consumption increases the availability also should increase. There are many fuel stations available in every area. But consider a situation where the vehicle stops due to the lack of fuel in an area which is far from the fuel station. In that case people usually push the vehicle to the nearest fuel station. This process is difficult and it is more difficult to the people those are unwell or aged.

In this case an application can be introduced which can be used for delivering fuel those who need to refuel the vehicle at their own location at any time. Those who needs the fuel can get it by placing an order in this application by paying an extra charge for the delivery.

MODULES

➤ ADMIN

➤ USER

➤ FUEL STATION MANAGER

➤ DELIVERY AGENT

MODULES

➤ ADMIN

- Login
- Verify fuel station
- Verify delivery agent
- View complaint
- Post reply

➤ FUEL STATION MANAGER

- Register
- Login
- Receive order
- Assign Delivery
- View Status
- Receive Payment

MODULES

➤ USER

- Register
- Login
- Search Fuel Station
- Place order
- Make Payment
- Post complaint
- View reply
- View delivery status
- Get delivery

➤ DELIVERY AGENT

- Register
- Login
- View delivery request
- Update delivery status
- Delivery

DEVELOPING ENVIRONMENT

- Front-End : Dart(Flutter)
- Back-End : Python(Django)
- Database : MySQL
- IDE : PyCharm, Android Studio
- Operating System : Windows 7 or Above , Android
- Processor : Intel Core i5
- RAM : 8 GB

METHODOLOGY

Fuel delivery on demand application is a mobile application that helps user to order fuel for the vehicle as per their needs. The system basically depends on GPS service. Thereby it helps the user to locate the near by fuel station and place the order. The system also helps the delivery agent to get the location of the user who placed the order.

The system mainly consist of four modules such as Admin, Fuel Station, User and Delivery Agent . The Admin and Fuel Station modules are represented using web application. These are created using Python Django. The rest two modules are done as mobile application which will be more suitable, considering the usage of the users. This is done using Flutter.

Django is a high-level open source Python web framework that encourages rapid development and clean, pragmatic design and it is also versatile in nature which allows to build applications for different-different domains. Now a days, Companies are using Django to build various types of applications like: content management systems, social networks sites or scientific computing platforms etc. It have simple syntax, HTTP libraries, Middleware support and a Python unit test framework.

PyCharm IDE is used for doing the web framework in this project. It is a dedicated Python Integrated Development Environment (IDE) providing a wide range of essential tools for Python developers, tightly integrated to create a convenient environment for productive Python, web, and data science development.

METHODOLOGY

As said above in this project flutter framework is also used for creating the mobile application part. Flutter is Google's free and open-source UI framework for creating native mobile applications. Flutter allows developers to build mobile applications with a single codebase and programming language. This framework contains SDK and their widget based UI library. Dart is a programming language designed for client development, such as for the web and mobile apps which is used in this framework. This language mainly focus on the development of front end. Dart is much easier to use so that it helps the developers to get tremendous control over the system.

The database system used in this project is the MySQL relational database management system. This database management system is based on SQL(Structured Query Language) queries. It can handle almost any amount of data, up to as much as 50 million rows or more. The default file size limit is about 4 GB. However, we can increase this number to a theoretical limit of 8 TB of data.
